Implement Phase 04 only, following `AGENTS.md`, `PROJECT_CONTEXT.md`, `PHASES.md`, and `phases/04-routing.md`.\
Review the existing repository, explain your implementation plan, and ask any blocking questions before coding.\
Complete the phase's acceptance criteria, run available tests, update `IMPLEMENTATION_STATUS.md`, and stop for my explicit validation. Do not implement any subsequent phases.

## Assistant – 2026-10-31T12:15:32.648Z

I'll review the repository and Phase 04 instructions, then explain the implementation plan and flag any blocking questions before coding.

## Assistant – 2026-10-31T12:16:02.931Z

The repository is clean, and Phase 03 has recorded human approval. Existing models already provide independent selections, unique event/delivery constraints, delivery status, attempt counts and timestamps. Phase 04 can build on these.

My plan is to:

1. Add a validated internal event boundary and dispatcher that atomically persists new events and eligible deliveries, handling duplicate-ID races.
2. Add `IChannelSender` and a recording fake; recheck user, topic, channel and selections before each send.
3. Persist outcomes and enforce at most three attempts, isolating failures between deliveries.
4. Add focused routing/retry tests and a controlled invocation showing persisted rows and fake calls.
5. Run build, tests and formatting checks; update `IMPLEMENTATION_STATUS.md` to `AWAITING HUMAN VALIDATION`, then stop.

One blocking decision needs your agreement before coding:

**May I implement persisted retries with a pending-delivery scan on startup and an explicit callable scan, using a one-second delay between retries?** I propose preserving attempt counts across restarts, recording each attempt before calling the sender, and leaving currently disabled or deselected deliveries pending until eligible again. An interrupted attempt would conservatively count toward the three-attempt cap.

This clarification is required by 04-routing.md [local file not included]: "Clarify whether retries are persisted/restarted on app launch before deciding." No files have been changed.

## User – 2026-10-31T12:17:01.197Z

Instead of 1 second restart use some exponential delays between recalls, otherwise the plan is approved. Proceed with the implementation

## Assistant – 2026-10-31T12:17:04.914Z

I'll use exponential retry delays of 1 second, then 2 seconds, with attempt counts preserved across restarts. I'll add the startup recovery scan, dispatcher, fake sender and tests within Phase 04 only.

## Assistant – 2026-10-31T12:18:20.793Z

The dispatcher now persists each event and its deliveries before sending, and reserves each attempt before calling a sender so restarts preserve the three-attempt cap. Retry timing derives from the last persisted attempt timestamp. I'm adding tests for restart recovery, disablement between attempts, and failure isolation.

## Assistant – 2026-10-31T12:20:25.835Z

The first test run passed all 39 tests, including routing, retry limits, duplicate IDs and recovery after cancellation. I've added two more checks for the registered startup recovery service and missing sender adapters. I'm finishing the validation guide and status log, then running the final checks.

## Assistant – 2026-10-31T12:21:59.207Z

Final checks passed: the build has zero warnings/errors, all 41 tests passed, and formatting verification passed. The controlled invocation showed two persisted `Succeeded` deliveries with one attempt each, plus one Email fake call and one Slack fake call. I'm recording the handoff; Phase 04 will remain awaiting your validation.

## Assistant – 2026-10-31T12:22:39.629Z

Phase 04 is implemented and marked **AWAITING HUMAN VALIDATION**.

- Added persisted routing, duplicate handling, fake senders and startup recovery.
- Enforced three attempts maximum, with exponential delays of **1 second, then 2 seconds**.
- Build passed with zero warnings/errors; **41 tests passed**; formatting and diff checks passed.
- Controlled invocation showed two successful delivery rows and one call per fake channel.

Changed files and test evidence are recorded in IMPLEMENTATION_STATUS.md [local file not included]. Follow the commands in the validation guide [local file not included] to review the phase.

Limitation: routing tests use EF InMemory; live PostgreSQL races were not retested. No subsequent phase was started.

Please explicitly approve Phase 04 or provide corrections.

## User – 2026-10-31T12:28:02.344Z

phase 04 is approved, edit status files

## Assistant – 2026-10-31T12:28:04.959Z

I'll record your Phase 04 approval in the status documents and leave Phase 05 unstarted.

## Assistant – 2026-10-31T12:28:20.158Z

Recorded Phase 04 as **APPROVED** in `IMPLEMENTATION_STATUS.md`, `README.md`, and the Phase 04 guide. Diff checks passed.

Phase 05 remains **NOT STARTED**, awaiting explicit instructions.
