Implement Phase 03 only, following `AGENTS.md`, `PROJECT_CONTEXT.md`, `PHASES.md`, and `phases/03-compose.md`.\
Review the existing repository, explain your implementation plan, and ask any blocking questions before coding.\
Complete the phase's acceptance criteria, run available tests, update `IMPLEMENTATION_STATUS.md`, and stop for my explicit validation. Do not implement any subsequent phases.

Assistant – 2026-10-31T11:57:12.148Z

I'll review the repository and Phase 03 instructions, then explain the implementation plan and raise any blocking questions before coding. I'll keep changes within this phase and stop for your validation after testing and updating the status.

Assistant – 2026-10-31T11:57:41.445Z

Phase 02 is recorded as approved. The repository has PostgreSQL migrations, opt-in development account seeding, and 17 tests; it has no Docker or health setup yet. The only untracked files are Phase 02 conversation records, which I'll leave untouched.

My Phase 03 plan is to:

- Add a multi-stage API image and Compose services for PostgreSQL, a one-shot migration command, and the API. PostgreSQL readiness and successful migrations will gate API startup.
- Add `/health` for liveness, JSON console logging, and development-only migration bootstrap with outcome event IDs.
- Keep existing opt-in account seeding, add environment placeholders, and document startup, restart, reset, authentication checks, and troubleshooting.
- Add focused tests, run build/test/format checks, and smoke-test Compose against a fresh volume.

There are no blocking questions. Explicit migrations fit the existing workflow and avoid migrating on every API startup. Docker is installed, but sandbox access to its daemon is denied; I'll retry through the available approval mechanism when testing.

Assistant – 2026-10-31T11:59:18.661Z

The implementation is in place, and the build passes with zero warnings or errors. Docker access now works through the approval mechanism. Next I'll test a fresh Compose database, migration reruns, and seeded authentication in an isolated project, and finish the validation guide. `/health` checks API liveness; PostgreSQL has its own readiness check.

Assistant – 2026-10-31T12:01:55.767Z

The fresh-volume Compose stack starts successfully: PostgreSQL becomes healthy, both migrations complete, and the API becomes healthy. All 19 tests and the format check pass. I'm now checking authentication, schema constraints, persistence after container recreation, and logs for accidental credential output.

Assistant – 2026-10-31T12:03:04.036Z

The composed API passes the authentication checks: anonymous access returns 401, the regular

user gets 403 on the admin probe, and the admin can access both user and admin endpoints. Migration reruns and container recreation preserve the database, and the Phase 02 relational checks pass.

The API runs as non-root. Bootstrap logs contain the expected JSON event IDs and no generated test passwords. Production migrations and startup with missing seed credentials both exit with code 1. I'm finishing the clean-volume reset check and status handoff.

Assistant – 2026-10-31T12:04:32.316Z

Phase 03 is implemented and marked **AWAITING HUMAN VALIDATION** in IMPLEMENTATION_STATUS.md [local file not included].

Added Dockerfile/build exclusions, PostgreSQL Compose services, explicit development migrations, `/health`, JSON bootstrap logs, environment placeholders, runtime tests, and setup documentation.

Validation passed:

- `dotnet build Alerts.sln --no-restore`: zero warnings/errors.
- `dotnet test Alerts.sln --no-build`: **19 passed**.
- `dotnet format Alerts.sln --verify-no-changes --no-restore` and Git whitespace checks.
- Compose fresh-volume startup, migration reruns, persistent-volume restart, clean reset, schema constraints, and user/admin authentication.
- Non-root runtime and credential-free bootstrap logs verified. Disposable validation resources were removed.

For manual validation, follow phase03-compose.md [local file not included]: configure `.env`, run `docker compose up --build`, then verify health, schema, authentication, and reset behavior.

Limitations: Compose is for local Development; `/health` checks liveness only, and API recreation invalidates sessions.

No blocking questions or scope deviations remain. No subsequent phase was implemented and no commit was created. **Please explicitly approve Phase 03 or provide feedback.** I'm stopped pending your validation.

User – 2026-10-31T12:10:35.293Z

manual human testing is done, approve the changes and edit the status files for the next phase, do not start phase 4

Assistant – 2026-10-31T12:10:37.672Z

I'll record your Phase 03 approval and update the handoff to show Phase 04 is awaiting explicit instructions. I won't start Phase 04.

Assistant – 2026-10-31T12:10:57.632Z

Recorded Phase 03 as **APPROVED**, including your validation confirmation, in IMPLEMENTATION_STATUS.md [local file not included] and updated README.md [local file not included].

Phase 04 remains **NOT STARTED**, awaiting explicit instructions. Documentation whitespace checks passed. No commit created.
