AGENTS.md instructions for D:\Temp\Sonrisa

<INSTRUCTIONS>

Project guidance for Codex

This repository is a 24-hour-scale interview exercise. The evaluation prioritizes the **authentic, inspectable reasoning and validation process** over feature breadth.

Product boundaries

Read `docs/PRODUCT_SCOPE.md`. Build an ASP.NET Core MVC / Razor, EF Core + SQLite prototype for users to define event alert rules and view matching events; SMTP and Slack webhook delivery; admin monitoring. Use a demo/seed event source and a clean source adapter seam. Avoid speculative third-party API integrations.

Non-negotiable engineering rules

- Do not claim success without executing checks and reporting command, exit code and outcome.

- Never invent human decisions, review findings, test results, screenshots, prompts or timestamps. Mark unperformed checks as NOT RUN.

- Do not quietly expand scope. State assumptions and tradeoffs.

- A matching event should generate at most one delivery per rule/channel/event despite retries; demonstrate idempotency.

- Avoid embedding secrets and credentials in source or logs. Keep .env, databases and real credentials untracked.

- Separate input/event normalization, matching rules, dispatch and delivery transports.

- No external send in automated tests. Stub email and Slack transports.

- Reviewer phases are read-only; do not modify files or make commits when reviewing.

- Do not commit, push, or publish from Codex. The external human-gated workflow owns commits after approval.

Evidence

The workflow launcher preserves actual AI prompts and responses in `docs/ai-process/runs/`; document architecture decisions in `docs/decisions.md` and real limitations in `docs/known-limitations.md`. Report uncertainty. When a review finds an issue, reference the affected files and an exact reproduction/check if possible.

You are the BUILDER on milestone 02-core: Solution skeleton, persistence and rule management. Read AGENTS.md, docs/PRODUCT_SCOPE.md, workflow/milestones.json and current project files. Implement only the following goal: Create runnable .NET MVC/Razor app, EF Core SQLite persistence, a simple user-facing rule management experience, migrations and necessary domain tests.
Acceptance: App launches; rules can be created, edited and disabled; tests cover validation and ownership boundaries.
Human constraints for this milestone:
(none)

Use modest, coherent engineering and realistic tests. Keep running verification while you work. Do not modify existing authentic AI log files. NEVER git commit or push. Report what you changed, paths touched, commands/tests actually run (including failures), assumptions, known limitations and anything needing human judgment. Mark not-tested things explicitly. Do not fake

review findings or evidence. If the scope is ambiguous, make a reasonable documented assumption rather than fabricate a requirement.

Assistant – 2026-10-30T23:14:08.634Z

I'll read the scope and current project, build the rule-management slice, and run focused checks as I go. I'll leave existing AI logs untouched and won't commit or push.

Assistant – 2026-10-30T23:14:31.352Z

The repo has planning documents but no application yet. I'll keep the planned .NET 10 target and fixed server-side demo identity. Rules will support Email and Slack selection; matching, delivery and admin pages remain in later milestones. Only SDK 7 is installed, so I'll first try a workspace-local .NET 10 SDK.

Assistant – 2026-10-30T23:17:06.389Z

The MVC forms and owner-scoped rule service are in place. They use a dedicated input model, and the UI states that no notifications are sent in this milestone. SDK and NuGet downloads are blocked by the sandbox, so full verification is currently unavailable. I'll continue with the migration and SQLite/HTTP tests, and check the domain code with the installed SDK where possible.

Assistant – 2026-10-30T23:20:31.083Z

The supplementary domain check passed: I compiled the actual domain files with the installed compiler and ran 29 assertions for validation, normalization, channel changes and repeated disable behavior. This does not verify EF or MVC.

The .NET 10 commands all stopped at SDK resolution, before restore, build, test, migration or startup. I'll document those exact results alongside the tests written and the checks still unverified.

Assistant – 2026-10-30T23:24:07.389Z

The evidence-writing command hit a PowerShell delimiter error and exited 1 without writing the file. I'll write it directly, then check file structure, ignored paths and the original AI-log hashes. Full acceptance remains blocked on .NET 10 and NuGet access.

Assistant – 2026-10-30T23:25:52.073Z

Implemented the milestone 02 source, but **acceptance remains unverified** because .NET 10 and NuGet access are unavailable.

- Added MVC/Razor rule list, create/edit and enable/disable forms.

- Added owner-scoped rule services, validation, EF Core SQLite persistence and a hand-authored migration.

- Added validation, SQLite ownership/persistence and HTTP antiforgery tests under `tests/Alerts.Tests`.

- Updated setup, architecture, decisions and limitations documentation.

Actual verification:

- Direct compilation of domain files and 29 supplementary assertions: **exit 0**.

- SDK version, tool restore, restore, build, test, migration and launch commands: **exit 2147516561**, SDK not found. Application operations and xUnit tests **NOT RUN**.

- Structural checks and builder-scoped whitespace check: **exit 0**.

- Repository-wide whitespace check: **exit 2** on the pre-existing authentic log; its hash remains unchanged.

Assumptions include a fixed demo owner, loopback HTTP and last-write-wins edits. Matching, delivery and admin features remain deferred.

Full evidence, commands and touched paths [local file not included] · Setup instructions [local file not included]

A .NET 10 SDK and NuGet restore access are needed to finish verification. No commits, pushes or edits to existing authentic AI logs were made.
