AGENTS.md instructions for D:\Temp\Sonrisa

<INSTRUCTIONS>

Project guidance for Codex

This repository is a 24-hour-scale interview exercise. The evaluation prioritizes the **authentic, inspectable reasoning and validation process** over feature breadth.

Product boundaries

Read `docs/PRODUCT_SCOPE.md`. Build an ASP.NET Core MVC / Razor, EF Core + SQLite prototype for users to define event alert rules and view matching events; SMTP and Slack webhook delivery; admin monitoring. Use a demo/seed event source and a clean source adapter seam. Avoid speculative third-party API integrations.

Non-negotiable engineering rules

- Do not claim success without executing checks and reporting command, exit code and outcome.

- Never invent human decisions, review findings, test results, screenshots, prompts or timestamps. Mark unperformed checks as NOT RUN.

- Do not quietly expand scope. State assumptions and tradeoffs.

- A matching event should generate at most one delivery per rule/channel/event despite retries; demonstrate idempotency.

- Avoid embedding secrets and credentials in source or logs. Keep .env, databases and real credentials untracked.

- Separate input/event normalization, matching rules, dispatch and delivery transports.

- No external send in automated tests. Stub email and Slack transports.

- Reviewer phases are read-only; do not modify files or make commits when reviewing.

- Do not commit, push, or publish from Codex. The external human-gated workflow owns commits after approval.

Evidence

The workflow launcher preserves actual AI prompts and responses in `docs/ai-process/runs/`; document architecture decisions in `docs/decisions.md` and real limitations in `docs/known-limitations.md`. Report uncertainty. When a review finds an issue, reference the affected files and an exact reproduction/check if possible.

Unclassified user-role record – 2026-10-30T23:25:55.387Z

You are an INDEPENDENT SKEPTICAL REVIEWER, NOT a builder. Read-only. Do not modify code or files or commit.
Milestone: 02-core - Solution skeleton, persistence and rule management
Expected acceptance: App launches; rules can be created, edited and disabled; tests cover validation and ownership boundaries.
Builder summary (untrusted):
Implemented the milestone 02 source, but **acceptance remains unverified** because .NET 10 and NuGet access are unavailable.

- Added MVC/Razor rule list, create/edit and enable/disable forms.

- Added owner-scoped rule services, validation, EF Core SQLite persistence and a hand-authored migration.

- Added validation, SQLite ownership/persistence and HTTP antiforgery tests under `tests/Alerts.Tests`.

- Updated setup, architecture, decisions and limitations documentation.

Actual verification:

- Direct compilation of domain files and 29 supplementary assertions: **exit 0**.

- SDK version, tool restore, restore, build, test, migration and launch commands: **exit

2147516561**, SDK not found. Application operations and xUnit tests **NOT RUN**.

- Structural checks and builder-scoped whitespace check: **exit 0**.

- Repository-wide whitespace check: **exit 2** on the pre-existing authentic log; its hash remains unchanged.

Assumptions include a fixed demo owner, loopback HTTP and last-write-wins edits. Matching, delivery and admin features remain deferred.

Full evidence, commands and touched paths [local file not included] · Setup instructions [local file not included]

A .NET 10 SDK and NuGet restore access are needed to finish verification. No commits, pushes or edits to existing authentic AI logs were made.

Deterministic validation: FAILED — see docs\ai-process\runs\02-core-validation-0.md.
Read current repository diff and relevant code/tests. Look for broken behavior, data leaks, missing access controls, duplicate delivery, broken exception handling, unrealistic assumptions and insufficient tests, as applicable. Challenge the builder's claims; verify via concrete file references. Distinguish confirmed defects from risks and unverified items. Never manufacture issues to make the log look interesting.
Respond with: VERDICT (PASS / NEEDS_FIX / BLOCKED); critical and major findings with file paths and reproduction suggestions; test gaps; which claims you actually verified; suggested minimal fixes. A PASS is allowed if nothing material is found.

Assistant – 2026-10-30T23:25:57.579Z

I'll read the scope, current diff, implementation, and tests, then attempt read-only checks. I'll separate confirmed defects from risks and blocked verification.

Assistant – 2026-10-30T23:26:23.744Z

Build and test commands both stop at SDK resolution with exit `2147516561`; only SDK 7.0.202 is installed. The owner filters and antiforgery configuration are present in source. I'm checking the hand-authored migration and form flows next; their runtime behavior remains unverified.

Assistant – 2026-10-30T23:28:17.742Z

I haven't found a confirmed critical or major defect in the source reviewed so far. Tests cover the intended validation and ownership boundaries, but none have executed. The main unresolved areas are migration/model agreement, rendering, and startup persistence. The HTTP tests also post hand-built fields, so they don't verify the rendered form actions and checkbox submissions.

Assistant – 2026-10-30T23:29:18.226Z

VERDICT: BLOCKED

No confirmed critical or major code defect found in the reviewed source. Milestone acceptance remains blocked because compilation, launch, migrations, and automated tests have not executed.

- **Acceptance blocker:** global.json [local file not included] requires .NET 10; this machine exposes only SDK 7.0.202. Independent command results:

Command	Exit	Outcome
`dotnet --list-sdks`	0	Only 7.0.202
`dotnet build Alerts.slnx --nologo --no-restore`	2147516561	SDK resolution failed
`dotnet test Alerts.slnx --nologo --no-build --no-restore`	2147516561	Tests NOT RUN
`dotnet run --project src/Alerts.Web --no-build --no-restore -- --urls http://127.0.0.1:5080`	2147516561	App NOT RUN

- **Unverified persistence risk:** the hand-authored migration [local file not included] and snapshot [local file not included] have no executed EF validation. This is not a confirmed mismatch. Reproduce on a compatible environment by applying the migration and running migration/model agreement tests [local file not included].

Test gaps: HTTP tests [local file not included] extract antiforgery tokens but submit hard-coded routes and fields; they do not exercise generated form actions or checkbox submission behavior. No test forces a database failure to verify rollback and safe error rendering. Fresh-connection persistence tests exist, but full process restart and browser walkthroughs are **NOT RUN**.

Claims verified by source inspection: ownership filtering covers service reads and mutations (RuleService.cs [local file not included]); input excludes ownership; global antiforgery validation is configured (Program.cs [local file not included]); views use ordinary Razor encoding. Validation, ownership, persistence, and antiforgery tests are present. These observations establish implementation intent, not passing runtime behavior.

The pinned SQLite package exists on NuGet (https://www.nuget.org/packages/Microsoft.EntityFrameworkCore.Sqlite/10.0.13); restore compatibility remains unverified. Matching and delivery are absent within the declared milestone boundary, so delivery idempotency has not been demonstrated.

Builder-scoped tracked whitespace checks and representative ignore checks independently returned **0**. Repository-wide `diff --check` returned **2** for `human-gates.md`. I did not independently rerun the builder's 29 supplementary assertions or verify historical log hashes.

Minimal next steps: provide .NET 10 and restore access, execute the README setup and full test suite, then demonstrate create/edit/disable and restart persistence. Check rendered form submissions and a controlled storage failure. Fix any resulting defects before acceptance.

No files were modified or commits made.
