AGENTS.md instructions for D:\Temp\Sonrisa

<INSTRUCTIONS>

Project guidance for Codex

This repository is a 24-hour-scale interview exercise. The evaluation prioritizes the **authentic, inspectable reasoning and validation process** over feature breadth.

Product boundaries

Read `docs/PRODUCT_SCOPE.md`. Build an ASP.NET Core MVC / Razor, EF Core + SQLite prototype for users to define event alert rules and view matching events; SMTP and Slack webhook delivery; admin monitoring. Use a demo/seed event source and a clean source adapter seam. Avoid speculative third-party API integrations.

Non-negotiable engineering rules

- Do not claim success without executing checks and reporting command, exit code and outcome.

- Never invent human decisions, review findings, test results, screenshots, prompts or timestamps. Mark unperformed checks as NOT RUN.

- Do not quietly expand scope. State assumptions and tradeoffs.

- A matching event should generate at most one delivery per rule/channel/event despite retries; demonstrate idempotency.

- Avoid embedding secrets and credentials in source or logs. Keep .env, databases and real credentials untracked.

- Separate input/event normalization, matching rules, dispatch and delivery transports.

- No external send in automated tests. Stub email and Slack transports.

- Reviewer phases are read-only; do not modify files or make commits when reviewing.

- Do not commit, push, or publish from Codex. The external human-gated workflow owns commits after approval.

Evidence

The workflow launcher preserves actual AI prompts and responses in `docs/ai-process/runs/`; document architecture decisions in `docs/decisions.md` and real limitations in `docs/known-limitations.md`. Report uncertainty. When a review finds an issue, reference the affected files and an exact reproduction/check if possible.

You are the BUILDER on milestone 02-core: Solution skeleton, persistence and rule management. Read AGENTS.md, docs/PRODUCT_SCOPE.md, workflow/milestones.json and current project files. Implement only the following goal: Create runnable .NET MVC/Razor app, EF Core SQLite persistence, a simple user-facing rule management experience, migrations and necessary domain tests.
Acceptance: App launches; rules can be created, edited and disabled; tests cover validation and ownership boundaries.
Human constraints for this milestone:
(none)

Use modest, coherent engineering and realistic tests. Keep running verification while you work. Do not modify existing authentic AI log files. NEVER git commit or push. Report what you changed, paths touched, commands/tests actually run (including failures), assumptions, known limitations and anything needing human judgment. Mark not-tested things explicitly. Do not fake

review findings or evidence. If the scope is ambiguous, make a reasonable documented assumption rather than fabricate a requirement.

CORRECTION PASS: Address validated reviewer/user concerns conservatively. Do not gratuitously rewrite working code.
SQLite package issues

Assistant – 2026-10-30T23:37:55.743Z

I'll inspect the milestone, current code and SQLite setup, then make a focused correction and run the relevant checks.

Assistant – 2026-10-30T23:38:40.528Z

The current failure occurs before SQLite restore: the project requires .NET 10, but this machine has only SDK 7.0.202. The pinned SQLite package is listed on NuGet; I haven't reproduced a package-specific error. An SDK download attempt was also blocked by the sandbox's domain allowlist. I'll record fresh command results and keep the package pins unchanged unless there's evidence for a change.

Assistant – 2026-10-30T23:39:31.990Z

The fresh restore, build, test, migration and launch attempts all failed with exit 2147516561 at SDK resolution, so acceptance remains blocked. I've added troubleshooting guidance and a correction-pass evidence file. The documentation checks passed, and all 16 captured AI log files remain byte-identical.

Assistant – 2026-10-30T23:39:40.831Z

SQLite correction remains blocked; no package defect was reproduced. The pinned SQLite package exists on NuGet (https://www.nuget.org/packages/Microsoft.EntityFrameworkCore.Sqlite/10.0.13), so code and dependency pins were preserved.

Changed only README.md, docs/decisions.md, docs/known-limitations.md and correction evidence [local file not included].

Verification:

- SDK listing: exit **0**, only 7.0.202 installed.
- Restore, build, test, migration and launch attempts: exit **2147516561**, requiring SDK 10.
- Documentation/hash/whitespace checks: exit **0**; 16 authentic log files unchanged.

Runtime and ownership tests: **NOT RUN**. SDK download was sandbox-blocked. Acceptance requires .NET 10 and NuGet access; any further package correction needs the exact SQLite error.

No commits or pushes.
