AGENTS.md instructions for D:\Temp\Sonrisa

<INSTRUCTIONS>

Project guidance for Codex

This repository is a 24-hour-scale interview exercise. The evaluation prioritizes the **authentic, inspectable reasoning and validation process** over feature breadth.

Product boundaries

Read `docs/PRODUCT_SCOPE.md`. Build an ASP.NET Core MVC / Razor, EF Core + SQLite prototype for users to define event alert rules and view matching events; SMTP and Slack webhook delivery; admin monitoring. Use a demo/seed event source and a clean source adapter seam. Avoid speculative third-party API integrations.

Non-negotiable engineering rules

- Do not claim success without executing checks and reporting command, exit code and outcome.

- Never invent human decisions, review findings, test results, screenshots, prompts or timestamps. Mark unperformed checks as NOT RUN.

- Do not quietly expand scope. State assumptions and tradeoffs.

- A matching event should generate at most one delivery per rule/channel/event despite retries; demonstrate idempotency.

- Avoid embedding secrets and credentials in source or logs. Keep .env, databases and real credentials untracked.

- Separate input/event normalization, matching rules, dispatch and delivery transports.

- No external send in automated tests. Stub email and Slack transports.

- Reviewer phases are read-only; do not modify files or make commits when reviewing.

- Do not commit, push, or publish from Codex. The external human-gated workflow owns commits after approval.

Evidence

The workflow launcher preserves actual AI prompts and responses in `docs/ai-process/runs/`; document architecture decisions in `docs/decisions.md` and real limitations in `docs/known-limitations.md`. Report uncertainty. When a review finds an issue, reference the affected files and an exact reproduction/check if possible.

Unclassified user-role record – 2026-10-30T23:39:44.083Z

You are an INDEPENDENT SKEPTICAL REVIEWER, NOT a builder. Read-only. Do not modify code or files or commit.
Milestone: 02-core - Solution skeleton, persistence and rule management
Expected acceptance: App launches; rules can be created, edited and disabled; tests cover validation and ownership boundaries.
Builder summary (untrusted):
SQLite correction remains blocked; no package defect was reproduced. The pinned SQLite package exists on NuGet (https://www.nuget.org/packages/Microsoft.EntityFrameworkCore.Sqlite/10.0.13), so code and dependency pins were preserved.

Changed only README.md, docs/decisions.md, docs/known-limitations.md and correction evidence [local file not included].

Verification:

- SDK listing: exit **0**, only 7.0.202 installed.

- Restore, build, test, migration and launch attempts: exit **2147516561**, requiring SDK 10.

- Documentation/hash/whitespace checks: exit **0**; 16 authentic log files unchanged.

Runtime and ownership tests: **NOT RUN**. SDK download was sandbox-blocked. Acceptance

requires .NET 10 and NuGet access; any further package correction needs the exact SQLite error.

No commits or pushes.

Deterministic validation: FAILED — see docs\ai-process\runs\02-core-validation-1.md.
Read current repository diff and relevant code/tests. Look for broken behavior, data leaks, missing access controls, duplicate delivery, broken exception handling, unrealistic assumptions and insufficient tests, as applicable. Challenge the builder's claims; verify via concrete file references. Distinguish confirmed defects from risks and unverified items. Never manufacture issues to make the log look interesting.
Respond with: VERDICT (PASS / NEEDS_FIX / BLOCKED); critical and major findings with file paths and reproduction suggestions; test gaps; which claims you actually verified; suggested minimal fixes. A PASS is allowed if nothing material is found.

Assistant – 2026-10-30T23:39:46.551Z

I'll review the diff, code, tests and recorded evidence read-only, then report confirmed defects separately from anything I cannot verify in this environment.

Assistant – 2026-10-30T23:40:29.898Z

Only SDK 7.0.202 is installed, which confirms the .NET 10 prerequisite is missing. The code has owner filters and antiforgery protection, with tests written for both; I'm checking their coverage and the hand-authored migration before drawing conclusions.

Assistant – 2026-10-30T23:41:55.274Z

The build, test and launch commands all fail before execution with exit 2147516561 because the SDK is missing. I also verified that NuGet lists SQLite 10.0.13 and its native bundle dependency. I have found no confirmed critical or major code defect; the remaining gaps are migration validation, submission of the rendered forms, and failure handling under a storage error.

Assistant – 2026-10-30T23:42:22.132Z

VERDICT: BLOCKED

No confirmed critical or major code defect found. Acceptance remains blocked: the app, migrations and automated tests have not executed.

- **Confirmed acceptance blocker:** global.json [local file not included] requires SDK 10.0.100 or compatible roll-forward; only SDK 7.0.202 is installed. I independently ran:

Command	Exit	Outcome
`dotnet --list-sdks`	0	Only 7.0.202
`dotnet build Alerts.slnx --nologo --no-restore`	2147516561	SDK resolution failed

| `dotnet test Alerts.slnx --nologo --no-build --no-restore` | 2147516561 | Tests NOT RUN |
| `dotnet run --project src/Alerts.Web --no-build --no-restore -- --urls http://127.0.0.1:5080` | 2147516561 | App NOT RUN |

- **Unverified persistence risk:** the hand-authored migration [local file not included] and snapshot [local file not included] have no executed EF validation. No mismatch is confirmed. Apply the migration on SDK 10 and run migration/model agreement tests [local file not included].

Test gaps:

- The HTTP helper [local file not included] extracts tokens but submits hard-coded routes and fields. Generated form actions and checkbox submission behavior remain untested.
- No test forces a persistence failure to verify atomic rollback and safe error rendering.
- Fresh-connection tests exist; a full process restart and browser create/edit/disable walkthrough are **NOT RUN**.

Claims I verified:

- RuleService [local file not included] filters reads and mutations by server-selected owner. RuleInput [local file not included] excludes ownership fields; Program.cs [local file not included] configures global antiforgery validation. Validation and ownership tests exist. These are source observations.
- NuGet lists SQLite 10.0.13 (https://www.nuget.org/packages/Microsoft.EntityFrameworkCore.Sqlite/10.0.13), including its native bundle dependency. Restore compatibility and native loading remain unverified.
- Whitespace and representative ignore checks returned **0**. A read-only SHA-256 comparison returned **0**, with all 16 logs matching the builder-supplied baseline; this establishes current equality only.
- I reviewed the full working-tree diff and untracked application/tests. Git alone cannot establish the correction pass's four-file-only attribution. I did not rerun the supplementary 29 assertions.

Minimal next steps: provide SDK 10 and restore access, execute the README setup and full test suite with a nonzero discovered test count, then verify rendered form submissions, restart persistence and controlled storage failure. Preserve dependency pins unless those checks reproduce a package defect.

No files were modified or commits made.
