AGENTS.md instructions for D:\Temp\Sonrisa

<INSTRUCTIONS>

Project guidance for Codex

This repository is a 24-hour-scale interview exercise. The evaluation prioritizes the **authentic, inspectable reasoning and validation process** over feature breadth.

Product boundaries

Read `docs/PRODUCT_SCOPE.md`. Build an ASP.NET Core MVC / Razor, EF Core + SQLite prototype for users to define event alert rules and view matching events; SMTP and Slack webhook delivery; admin monitoring. Use a demo/seed event source and a clean source adapter seam. Avoid speculative third-party API integrations.

Non-negotiable engineering rules

- Do not claim success without executing checks and reporting command, exit code and outcome.

- Never invent human decisions, review findings, test results, screenshots, prompts or timestamps. Mark unperformed checks as NOT RUN.

- Do not quietly expand scope. State assumptions and tradeoffs.

- A matching event should generate at most one delivery per rule/channel/event despite retries; demonstrate idempotency.

- Avoid embedding secrets and credentials in source or logs. Keep .env, databases and real credentials untracked.

- Separate input/event normalization, matching rules, dispatch and delivery transports.

- No external send in automated tests. Stub email and Slack transports.

- Reviewer phases are read-only; do not modify files or make commits when reviewing.

- Do not commit, push, or publish from Codex. The external human-gated workflow owns commits after approval.

Evidence

The workflow launcher preserves actual AI prompts and responses in `docs/ai-process/runs/`; document architecture decisions in `docs/decisions.md` and real limitations in `docs/known-limitations.md`. Report uncertainty. When a review finds an issue, reference the affected files and an exact reproduction/check if possible.

Unclassified user-role record – 2026-10-30T23:50:22.219Z

You are an INDEPENDENT SKEPTICAL REVIEWER, NOT a builder. Read-only. Do not modify code or files or commit.
Milestone: 02-core - Solution skeleton, persistence and rule management
Expected acceptance: App launches; rules can be created, edited and disabled; tests cover validation and ownership boundaries.
Builder summary (untrusted):
Correction source changes are complete; milestone acceptance remains **BLOCKED by NuGet access**.

Changed six paths:

- Added `tests/Alerts.Tests/RenderedRuleFormTests.cs` for generated actions and checkbox submissions.

- Added `tests/Alerts.Tests/RuleStorageFailureTests.cs` for SQLite rollback and safe error rendering.

- Updated `README.md`, `docs/decisions.md`, `docs/known-limitations.md`.

- Added detailed validation evidence [blocked invalid-link].

Actual checks:

| Check | Exit/outcome |

|---|---|
SDK resolution	0 — SDK 10.0.403 available
Online restore	Sandbox rejected NuGet; exit unavailable
Offline restore/build	1 — required packages missing
Test/launch/EF attempts	1 — assemblies/tool unavailable
Whitespace and log integrity	0 — 23 existing logs unchanged

New tests, migration agreement, browser walkthrough and process restart are **NOT RUN**. Application code, migrations and dependency pins were preserved; no package defect was established.

NuGet access is required before acceptance can be judged. No commits or pushes were made.

Deterministic validation: PASSED — see docs\ai-process\runs\02-core-validation-2.md.
Read current repository diff and relevant code/tests. Look for broken behavior, data leaks, missing access controls, duplicate delivery, broken exception handling, unrealistic assumptions and insufficient tests, as applicable. Challenge the builder's claims; verify via concrete file references. Distinguish confirmed defects from risks and unverified items. Never manufacture issues to make the log look interesting.
Respond with: VERDICT (PASS / NEEDS_FIX / BLOCKED); critical and major findings with file paths and reproduction suggestions; test gaps; which claims you actually verified; suggested minimal fixes. A PASS is allowed if nothing material is found.

Assistant – 2026-10-30T23:50:24.751Z

I'll review the diff, rule management code, and validation evidence read-only, then run the checks this environment permits. I'll distinguish confirmed defects from unverified behavior.

Assistant – 2026-10-30T23:51:05.984Z

The latest validation log reports a successful build and 48 passing tests, so it supersedes the builder summary's NuGet blocker. Compiled assemblies are also present. I'm checking the test coverage and persistence code; I haven't independently reproduced those runtime results.

Assistant – 2026-10-30T23:52:20.331Z

I haven't found a critical or major defect in rule management. The new tests cover generated form actions, checkbox submissions, and rollback/error rendering. Independent test discovery failed because MSBuild cannot create a temporary directory in this read-only sandbox; the separate validation log reports all 48 tests passing. A browser walkthrough and full process restart remain unverified.

Assistant – 2026-10-30T23:53:43.358Z

The current source checksums match the compiled artifacts for all 14 C# files and all six Razor

files, which supports applying the successful validation log to this checkout. The remaining acceptance gap is the browser and process-restart check explicitly required by AC-01. The README also still describes the earlier restore failure as current.

Assistant – 2026-10-30T23:53:53.425Z

VERDICT: BLOCKED

No confirmed critical or major code defect found. The remaining blocker is required acceptance evidence.

- **Browser/restart acceptance remains unverified.** AC-01 [local file not included] requires persisted creation, edits and disabling across a process restart; the validation strategy [local file not included] explicitly requires a browser/restart check. Persistence tests [local file not included] reopen database connections, but do not restart the application process. Minimal next step: execute README steps 1–5 [local file not included] in a writable environment and record actual observations.

The reported NuGet blocker is superseded by the latest validator log [local file not included]: build exit **0**, test exit **0**, **48 passed, zero failed/skipped**. These are recorded validator results, not independently rerun results.

I independently verified:

Check	Exit	Outcome
`dotnet --version`	0	SDK 10.0.403
Command-scoped `git diff --check`	0	No whitespace errors
Read-only Python source/PDB checksum checks	0	All 14 C# and six Razor files matched compiled artifacts
`git check-ignore --no-index` probes	0	Environment, database and key paths ignored
`dotnet test Alerts.slnx --no-build --no-restore --nologo --list-tests`	-532462766	MSBuild temporary-directory access denied; discovery **NOT RUN**

Source inspection confirms owner filtering throughout RuleService [local file not included], input excluding ownership fields, global antiforgery validation, and transactional rule/channel saves. The new form tests [local file not included] and storage-failure tests [local file not included] address the previous coverage gaps.

A minor documentation correction is also needed: README [local file not included] still says no compiled assemblies exist and tests remain unrun. Update current-status documentation to reference validation pass 2; preserve historical logs.

No code or dependency fix is currently justified. Delivery idempotency remains outside this milestone and is unverified. Six-path change attribution and historical log preservation were not independently established. No files were modified or commits made.
