Implement Phase 01 only, following `AGENTS.md`, `PROJECT_CONTEXT.md`, `PHASES.md`, and `phases/01-skeleton.md`.\
Review the existing repository, explain your implementation plan, and ask any blocking questions before coding.\
Complete the phase's acceptance criteria, run available tests, update `IMPLEMENTATION_STATUS.md`, and stop for my explicit validation. Do not implement any subsequent phases.

Assistant – 2026-10-31T11:01:13.784Z

I'll review the repository and Phase 01 requirements, then explain the implementation plan and raise any blocking questions before coding.

Assistant – 2026-10-31T11:01:35.560Z

Phase 00 is recorded as approved, and the working tree is clean. The repository currently contains a minimal .NET 10 host and one smoke test.

There is a filename mismatch: `phases/01-skeleton.md` does not exist. The phase plan identifies Phase 01 as authentication, defined in `01-auth.md` [local file not included].

My proposed implementation plan:

1. Add ASP.NET Core Identity with PostgreSQL persistence and Identity-only migrations.
2. Implement cookie login, logout, session checking, protected `me`, and an admin-only probe, including CSRF protection.
3. Add development-only account seeding and server-side authorization/disabled-user checks.
4. Add focused unit tests, run build/test/format checks, and document repeatable manual validation commands.
5. Update `IMPLEMENTATION_STATUS.md` to `AWAITING HUMAN VALIDATION` and stop.

Before coding, please confirm these blocking decisions:

- **Scope:** Follow the existing `01-auth.md`?
- **Accounts:** Seed a development admin and regular user using credentials supplied through environment/configuration, with no public registration?
- **Authentication:** Use cookies with same-origin Angular/backend deployment?
- **Disabled users:** Block both sign-in and authenticated requests, including requests using an existing session?

No files have been changed. These confirmations are required by `AGENTS.md` [local file not included], which says to "stop and wait" on unresolved behavior, security, persistence, or architecture decisions.

User – 2026-10-31T11:09:47.879Z

Scope: yes
Accounts: that is right, user registration will be invited/added by admin only the MVP does not include user registration
Authentication: approved
Disabled user: disabling a user should block new requests as well as login processes.

Assistant – 2026-10-31T11:09:52.253Z

I'll implement Phase 01 authentication with development-only seeded accounts and same-origin cookies. Disabled accounts will be denied login, and existing sessions will be checked on each request. Public registration stays out of scope.

Assistant – 2026-10-31T11:11:37.293Z

The auth code is in place: login and logout require CSRF tokens, admin access uses a server-side role policy, and cookie validation checks account status on every request. Next I'll add focused tests and generate the Identity-only PostgreSQL migration.

Assistant – 2026-10-31T11:14:21.025Z

The focused tests pass for role access, CSRF, lockout, logout, and immediate rejection of disabled users' sessions. The Identity migration also applied to a fresh PostgreSQL database, reapplied without changes, and passed the model-drift check. I'm now checking the seeded login flow against that database and writing the validation instructions.

Assistant – 2026-10-31T11:17:07.952Z

The PostgreSQL-backed checks passed: anonymous access returned 401; the regular user could call `me` but received 403 from the admin probe; and the admin could call both. After disabling the regular user in the database, both the existing session and a new login attempt returned 401.

All 12 automated tests pass. I'm finishing the status log and final checks, then I'll stop for your validation.

Assistant – 2026-10-31T11:18:27.725Z

Phase 01 is implemented and marked **AWAITING HUMAN VALIDATION** in IMPLEMENTATION_STATUS.md [local file not included].

Added Identity/PostgreSQL persistence, development account seeding, cookie login/logout, CSRF protection, session checking, and server-side admin authorization. Disabled accounts are denied login and subsequent requests using existing sessions.

Verification passed:

- `dotnet build` – zero warnings/errors.
- `dotnet test` – 12 passed.
- `dotnet format --verify-no-changes` and `git diff --check`.
- Fresh PostgreSQL migration, repeat application, and model-drift check.
- Live anonymous/user/admin access checks and disabled-session rejection.

Changed files and limitations are recorded in the status log. Follow the validation instructions

[local file not included] to repeat setup and API checks. No blocking questions remain.

Please explicitly approve Phase 01 or provide feedback. I've stopped; no subsequent phase was implemented and no commit was created.

User – 2026-10-31T11:30:32.841Z

Phase 01 human tests are confirmed, update the implementation status

Assistant – 2026-10-31T11:30:35.424Z

I'll record your approval and leave Phase 02 unstarted.

Assistant – 2026-10-31T11:30:47.075Z

Updated IMPLEMENTATION_STATUS.md [local file not included]: Phase 01 is **APPROVED**, with your confirmation recorded. Phase 02 remains unstarted, awaiting explicit instructions.
